Babu Somasundaram

CO-FOUNDER, OGP LABS PTE. LTD. · SOFTWARE ARCHITECT · AI PRODUCT ENGINEERING

Trivandrum, India · Remote / Global · babu.work · linkedin.com/in/babusomasundaram

SUMMARY

Software architect and product engineer, 17 years. Two companies co-founded — one acquired after raising $3.7M with Comcast Ventures leading — and the years between them as an enterprise cloud architect for T-Mobile. Today I am Co-Founder and lead the engineering at OGP Labs, where I own all engineering across two live AI products, from architecture and data model through to infrastructure and deploy. I design, direct and verify production software built largely by AI coding agents — which is how both reached production inside a single year with the test discipline intact.

EVIDENCE

2	1,799	17,000+	4,370+	49B+
LIVE AI PRODUCTS	MERGES TO PRODUCTION	AUTOMATED TESTS	PROMPTS → 215,000+ AGENT TURNS	TOKENS PROCESSED

Commits, merges and tests counted from git and the test suites of both OGP Labs codebases, Feb – 13 Nov 2026. Prompts, agent turns and tokens counted from Claude Code session transcripts for Feb – 11 Aug and 12 Oct – 13 Nov 2026; the weeks between were not retained, so those three are floors. Engineering is mine end to end; product and design with my co-founder.

EXPERIENCE

Co-Founder & Architect — OGP Labs PTE. LTD.

Trivandrum, India · Remote / Global · 2026 – Present

OGP Labs helps startups build their software products from 0 to 1 — product, design and development, full stack. Founder-friendly and AI-native.

- Own all engineering across two live AI products end to end — architecture, data modeling, backend, frontend, infrastructure, CI/CD and production operations.
- Built an AI-native development workflow — Claude Code driving implementation under a custom tooling layer of planning skills, review-feedback loops and promoted guardrails, with work fanned out across parallel agent worktrees — that compresses product timelines from quarters to weeks: two products from first commit to production inside six months, at 49 agent turns per human prompt.
- Own the decisions that do not compress: architecture, data model, and the definition of correct. Agents carry implementation in parallel; the release gate stays human — automated tests as the contract, plus a live MCP-driven browser walk before anything counts as done.
- Designed and built the engineering toolkit every OGP Labs codebase runs on, so a new surface starts from a written standard rather than a conversation, and a defect caught once is not caught again three tickets later.
- Standardised both products on one platform spine — FastAPI and Strawberry GraphQL over SQLAlchemy / Alembic on PostgreSQL, React and TypeScript on the client, shipped to Railway behind Cloudflare via GitHub Actions — so a pattern proven on one product transfers to the other without redesign.

Consilo consilo.ai

AI business-automation platform for founders and small teams: autonomous agents for email, social and calendar; an AI Council running four frontier models against one strategic question in parallel; and a generation suite for documents, decks and media, grounded in the customer's own business context. I engineered the multi-model routing over OpenRouter, the pgvector retrieval store and the agent runtime.

7,119 commits · 1,186 merges to main · 13,405 automated tests · 2,362+ prompts · 137,054+ agent turns · 99.4M+ tokens generated

Variotype variotype.com

An AI product designer: it studies a product's users, gathers inspiration and produces several fully coded design directions to iterate on, review and share. I engineered the parallel generation pipeline with SSE streaming, an isolated containerised render service, and an OAuth-secured MCP server exposing the design system to coding agents.

3,277 commits · 613 merges to main · 3,999 automated tests · 2,011+ prompts · 78,216+ agent turns · 58.2M+ tokens generated

The OGP Labs engineering toolkit internal · every OGP Labs codebase runs on it

The engineering system behind both products: workflow skills that take a ticket from plan to a reviewed pull request, architecture patterns, service guides and safety hooks, installed in one command. A review feedback loop turns any defect seen twice into a guardrail agents read before their first edit; merging and security review stay human-triggered.

492 commits · 204 merged PRs · 18 workflow skills · 35 patterns · 16 service guides · 3,700+ review findings logged

Senior Enterprise Architect — T-Mobile (via UST) Trivandrum, India · 2024 – 2026

- Cloud-security and compliance automation across large-scale AWS and Azure estates at a Tier-1 US telecom — turning written compliance policy into automated, continuously evaluated controls.
- Codified IT governance requirements as machine-checkable policy, so control coverage across the cloud estate became a reported number rather than a periodic manual audit.
- Ran change management for control rollouts — staged introduction, exception handling and remediation paths — so tightening a control did not break the delivery teams operating under it.
- Worked across security, platform and application teams, translating security findings into remediation work engineers could act on and status the programme could report.

Associate Architect — QBurst Technologies Trivandrum, India · 2023 – 2024

- Designed and prototyped generative-AI solutions on OpenAI APIs, Llama 3, LangChain and LlamaIndex — retrieval pipelines, embedding stores and prompt patterns, evaluated against cost and latency before any client commitment.
- Mentored engineers new to LLM work through design reviews and paired build sessions, and wrote the reference patterns the team reused across engagements.
- Translated model behaviour and its limits into terms client stakeholders could plan against — what the technology could commit to, what it could not, and what it would cost to run.

Lead Developer — Uplift Agency Ltd. (Contract) Boulder, CO · Remote · 2021 – 2023

- Contract engineering lead across the agency's client portfolio — early-stage startups with no in-house senior engineer — owning architecture, estimation and code review, and running delivery against client-side product owners.
- Led development in Python / Django, TypeScript and GraphQL, and left each client team with the branching, review and release process to carry on after handover.

Co-Founder & CTO — Upcomer Inc. Los Angeles, CA · Remote · 2016 – 2021

- Raised $3.7M across three rounds with Comcast Ventures as lead investor.
- Built and launched Upcomer Esports: 5M lifetime users, 40K monthly actives and 100K mobile app users, rated 4.0 of 5 across 9.5K Play Store reviews. Acquired by Enthusiast Gaming.
- Built and launched Circles Live with store subscriptions and one-time payments; rated 4.8 and 4.9 of 5 on Play and App Store.
- Scaled Python / Django REST backends on AWS; built a real-time chat backend on API Gateway WebSockets and Lambda, a Go service talking to Django over JWT, and a GraphQL prototype on AppSync and DynamoDB.
- Led backend, web and mobile teams as technical manager — staffing, design, architecture, budgeting and execution — and carried the technical story to the people funding it, presenting architecture and roadmap to product managers, the C-suite and investors across three rounds.

Lead Engineer — QBurst Technologies Trivandrum, India · 2012 – 2016

- Led and delivered Django projects for several clients as developer, consultant and trainer.

Associate Software Engineer — Pivot Systems Trivandrum, India · 2009 – 2012

- Developed and maintained VoiceXML (IVR / ASR) interactive voice response systems; trained in Python.

TECHNICAL

AI ENGINEERING LLM Application Architecture · Agentic Workflows & Multi-Agent Orchestration · Model APIs: OpenAI, Claude Platform, Google AI Studio, OpenRouter · Tool Calling & Structured Outputs · RAG, Embeddings & Vector Search (pgvector) · Model Context Protocol (MCP) · Streaming Inference (SSE) · Prompt & Context Engineering · Token Accounting & Cost Control · Caching, Rate Limiting & Quotas · Document Ingestion Pipelines · Image & Video Generation · AI-Assisted Development with Claude Code

LANGUAGES Python · TypeScript · JavaScript · Go · SQL

BACKEND & DATA FastAPI · Django · GraphQL (Strawberry, Apollo, AppSync) · REST · SQLAlchemy · Alembic · Pydantic · WebSockets · Server-Sent Events · PostgreSQL · Supabase · DynamoDB · Redis / ElastiCache · Schema Design & Migration Strategy

CLOUD & INFRA AWS (Lambda, API Gateway, Beanstalk, RDS, S3, CloudFront, Route 53, CloudWatch) · Azure · GCP · Railway · Cloudflare · Docker · Serverless Framework · GitHub Actions · Cloud Security & Compliance Automation · IT Governance & Policy-as-Code

FRONTEND & QUALITY React · Apollo Client · Tailwind CSS · pytest · Playwright · Test-Driven Development · Sentry · PostHog · Inngest · Stripe · Release Management · Production Incident Response

LEADERSHIP Software Architecture · Technical Leadership · Hiring & Mentoring · Product & Roadmap Ownership · Change Management · Cross-Functional Collaboration · Technical Communication & C-Suite / Product-Manager Stakeholder Management · Engineering Documentation & Knowledge Sharing

EDUCATION

Bachelor of Engineering, Computer Science — Kamaraj College of Engineering and Technology, Anna University, Chennai, India 2005 – 2009
